

Conclusion

Conclusion

The **House Rent Management System** is a web-based application developed using the **MERN Stack (MongoDB, Express.js, React.js, and Node.js)** to simplify the process of searching, managing, and booking rental properties. The application provides secure user authentication using **JWT**, efficient property management, online booking functionality, and a responsive user interface.

The project successfully demonstrates the integration of frontend, backend, and database technologies to build a complete full-stack application. It offers a simple and user-friendly platform for tenants to browse properties and make bookings, while enabling administrators to manage property listings efficiently.

Overall, the House Rent Management System meets the project objectives and serves as a strong foundation for future enhancements such as online payments, real-time notifications, advanced search filters, and cloud deployment.
