

Project Design Phase

Proposed Solution

Date: 13-07-2026

Team ID: SWTID-2026-7371

Project Name: House Rent

Proposed Solution:

S.NO	Parameter	Description
1.	Problem Statement (Problem to be Solved)	Finding a suitable rental house is often time-consuming because users depend on brokers, newspaper advertisements, or social media. Property details are usually incomplete, booking is handled manually, and communication between property owners and tenants is inefficient.
2.	Idea / Solution Description	The proposed House Rent Management System is a web application developed using the MERN Stack. It enables users to register, log in securely, browse available rental properties, search by title or location, view complete property details, and book houses online. Property information is stored in MongoDB Atlas, while the admin can manage property listings efficiently.
3.	Novelty / Uniqueness	The application combines secure JWT authentication, responsive React-based user interface, property search, online booking, and centralized property management in a single platform. It provides a simple and user-friendly experience for both tenants and administrators.
4.	Social Impact / Customer Satisfaction	The system reduces the time and effort required to find rental houses. It improves transparency by providing complete property information and enables users to book houses conveniently from anywhere, increasing customer satisfaction and reducing dependency on intermediaries.
5.	Business Model (Revenue Model)	The platform can generate revenue through premium property listings, featured advertisements, subscription plans for property owners, and commission charges on successful bookings.
6.	Scalability of the Solution	The application follows a modular MERN Stack architecture, making it easy to add future features such as online payment integration, user reviews, advanced search filters, notifications, and mobile application support without affecting the existing system.

Summary:

The House Rent Management System provides a modern and efficient solution for rental property management. It simplifies property searching and online booking through a secure, responsive, and user-friendly MERN Stack application. The system benefits both tenants and property owners while offering opportunities for future enhancements and business growth.
